Oral selection: all rows

Oral sampling site OR oral disease. Red: increased; blue: decreased positive-z profile fraction. Numbers are increased minus decreased fractions; max n = largest per-trait study count in each row. Dark border: BH-adjusted q <= 0.05 (0 oral cells); 1 oral cells met nominal Fisher p < 0.01; original 2388-cell family retained. Displayed cells retain source support (>=3 positive-z profiles in either direction and >=2 studies) and require |effect|>0.01. Gray: unavailable, below source support, or at/below the absolute-effect cutoff; it does not indicate nonsignificance. Source tests are profile-level diagnostics.
