Oral selection: all rows

Oral sampling site OR oral disease. Red: increased; blue: decreased positive-z profile fraction. Numbers are increased minus decreased fractions; max n = largest per-trait study count in each row. Dark border: source BH q <= 0.05 (0 oral cells); original 2379-cell family retained. Gray: unavailable or below source support (>=3 positive-z profiles in either direction and >=2 studies), not nonsignificant. Source tests are profile-level diagnostics.
